

FIBERCOMBI

ANIMAL HEALTH AND WELFARE

Unique Hygiene powder

Fibercombi® is a unique hygiene product for barns, which improves sanitary conditions and can be used with the animals present. It is composed of various specially selected ingredients each of which contributes to optimal well-being and health.

Fibercombi® can complement other hygiene products like e.g. Basic® and completely replace other use of drying agents, potato flour/starch and bedding material.

Fibercombi® is suitable for prevention of infection and for improvement of sanitary conditions for all kinds of livestock and in all housing systems.

Fibercombi® has an enormously high absorption capacity because of its complex composition, which also includes toxin binder, rape fibres, potato starch and potato fibres.

Fibercombi® is primarily used on the animals' lying areas. The enormous absorption capacity of **Fibercombi®** creates a very dry immediate environment and contributes this way to eliminate the living conditions of harmful pathogens and fly maggots.

Fibercombi® packaging size:

20 kg plastic bag

1.000 kg bigbag

Fibercombi® storage:

Dry, out of sunlight, closed bag after use

- Represses hatching conditions for flies and other insects
- Represses the growth of noxious bacteria
- Suitable for all kinds of animals and housing systems
- Improves the housing environment
- Hygiene product that is easy to handle
- Enormously high absorption capacity – strong drying out effect
- Good binder of ammonia
- Reduces the smell of ammonia
- Economical in use
- Increases the revenue

FIBERCOMBI

ANIMAL HEALTH AND WELFARE

Instructions for use

Fibercombi® is used as a traditional hygiene product without moving the animals and can be applied by hand or machine. **Fibercombi®** can be applied as a complete bedding material but can also be mixed with other beddings before use.

Under normal circumstances **Fibercombi®** is used 2-3 times a week. Yet the amount should be adapted to each housing environment and under worse conditions **Fibercombi®** should be applied every day.

Fibercombi® is generally dosed with 50 g (a handful) per m². At start up an even layer is applied in the area that is required dry, corresponding to approximately 50 g per m². Subsequently remove wet material and replace it with new.

Fibercombi® - laying hens

Apply **Fibercombi®** in an even layer in the nests and on the floor in the moist areas. After moving in a new group of hens, **Fibercombi®** should be used daily the first 4 days and afterwards regularly 2-3 times a week. By consequent use of **Fibercombi®** a dry environment is ensured, ammonia is bound and moist is absorbed. This way it is avoided that the bedding becomes too moist, because a moist bedding can lead to ammonia, which can result in etching and damages to the foot pads.

Fibercombi® - broiler chickens

After all chickens are removed and the barn is cleaned thoroughly, **Fibercombi®** can beneficially be applied in the empty barn in an even layer. Subsequently the common bedding such as straw or wood shavings is applied, before **Fibercombi®** is spread again on top of the common bedding. When the new chickens are moved in, **Fibercombi®** is applied 2-3 times a week until slaughter.

In case of problems like a higher pressure of infection, or under especially moist conditions, the consumption of **Fibercombi®** should be increased according to 75-100 g per m² floor area until conditions are back to normal.
