

Lundbechlund I/S – 1.400 Sows incl. piglets up to 30 kg

We are convinced that Basic and FiberCombi contribute to keeping the pressure of infection down and the surroundings of the animals dry, so the pigs are really thriving.

We use Destek ApS' hygiene program including the drying agent FiberCombi and the dry disinfectant Basic. We are really satisfied with Destek's complete hygiene program and have been using it since 2008.

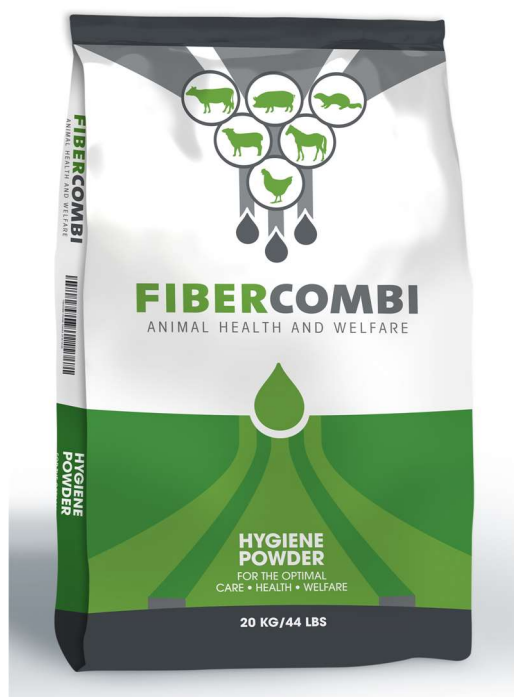

We paint our Farrowing pens with lime and use Basic under the sows before we move them in, because the lime is too hard on the sow's skin. It works very well and is gentle on the udder. For the piglets we spread FiberCombi in the lying area just before farrowing. This makes the piglets dry fast and this way reduces the risk of diarrhoea.

Furthermore, we use FiberCombi until the piglets are about 14 days old and afterwards when needed. We take a round every day and apply to all the piglet nests where we can see the beginning of moist or diarrhoea. This way we can keep the nests dry which reduce the occurrence of diarrhea as well.

We use Basic on all aisles every Friday. Both in the farrowing section, the weaner section and on the main aisle between the sections. This way we reduce the risk of infection every time we step in and out of a pen or when we move from one section to another. We move many of the animals on Thursdays, so it suits well that the aisles are washed and get a new layer of Basic the day after, which we apply with a simple to-wheel fertilizer wagon.

In the weaner section we spread Basic every Monday and Friday. We take it as a good sign that the feed intake of the piglets rises substantially the day after we have applied Basic and that our mortality rate in the weaner section now is stabilized around 1,8 %. We are convinced that Basic contributes to keeping the pressure of infection down and the surroundings of the animals dry, so the pigs are really thriving.

Torben, Lundbechlund
